Docket No. 02297-PA

Inventor: Hepburn et al

ABSTRACT OF THE DISCLOSURE

In an adjustable splint assembly having a lower strut and an upper strut, and having there

between a pivotably mounted head portion defining a cam surface, the improvement comprising the

lower strut being provided with a loading screw, a spring and a spring spacer with a graduated

number series thereon all contained within an inner housing tube with a single window and wherein

the lower strut has an outer lower leg tube provided with a series of windows, and depending on the

length of the lower strut, the graduated number series will register with a window in said series of

windows and the window of the inner housing tube so that the amount of tension being applied by

the loading screw can be read at that particular window of the outer lower leg tube.
